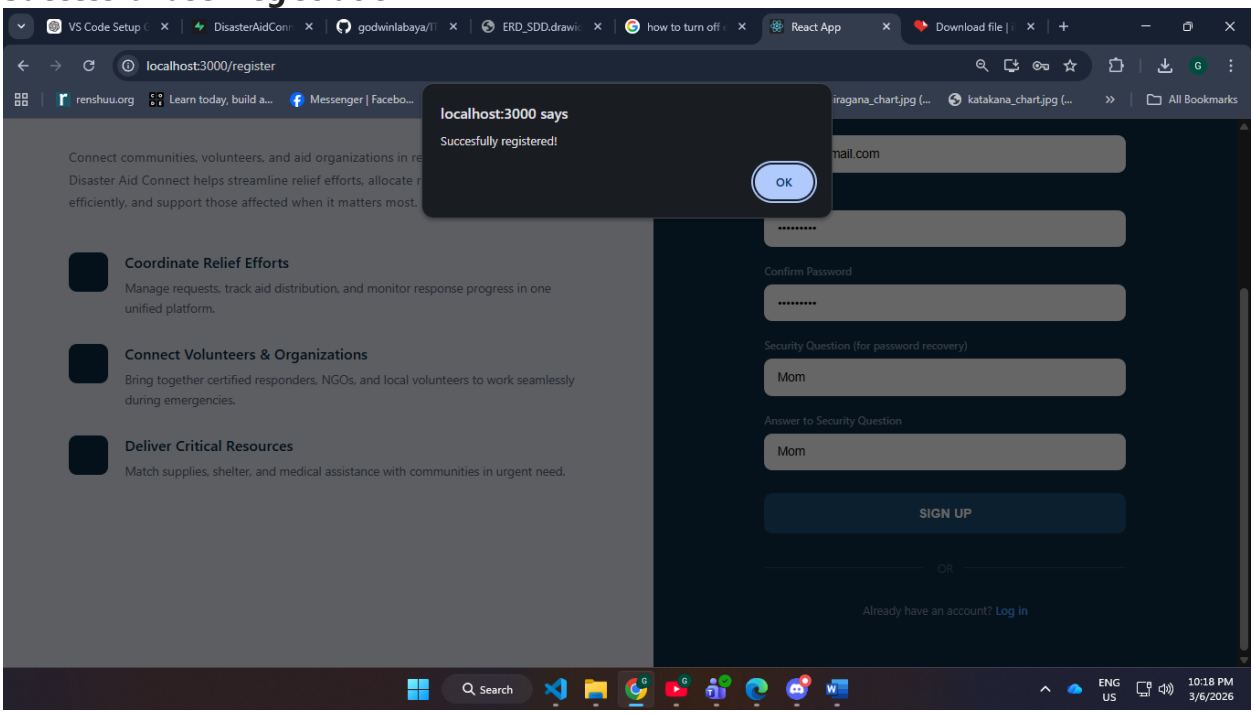
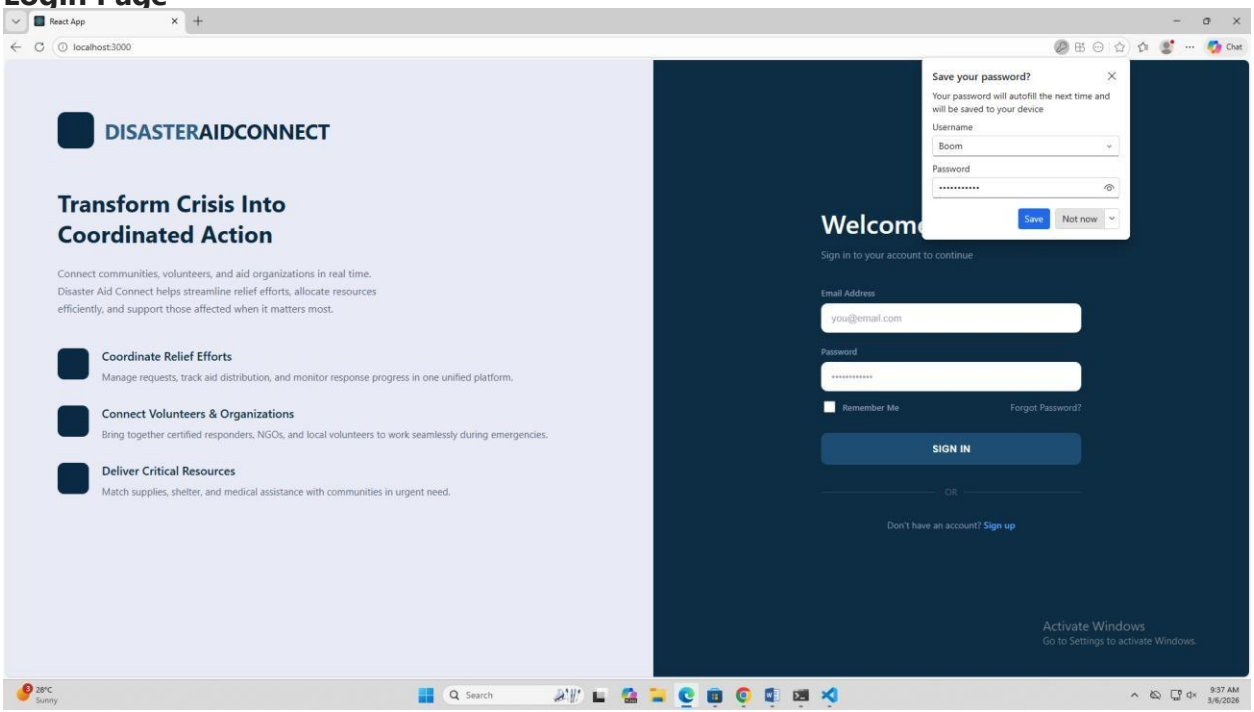
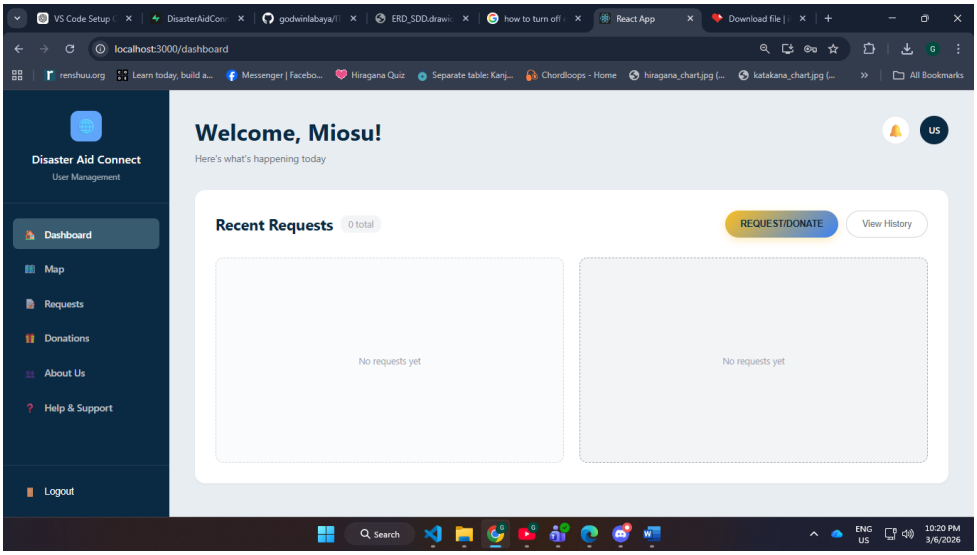
Successful user registration



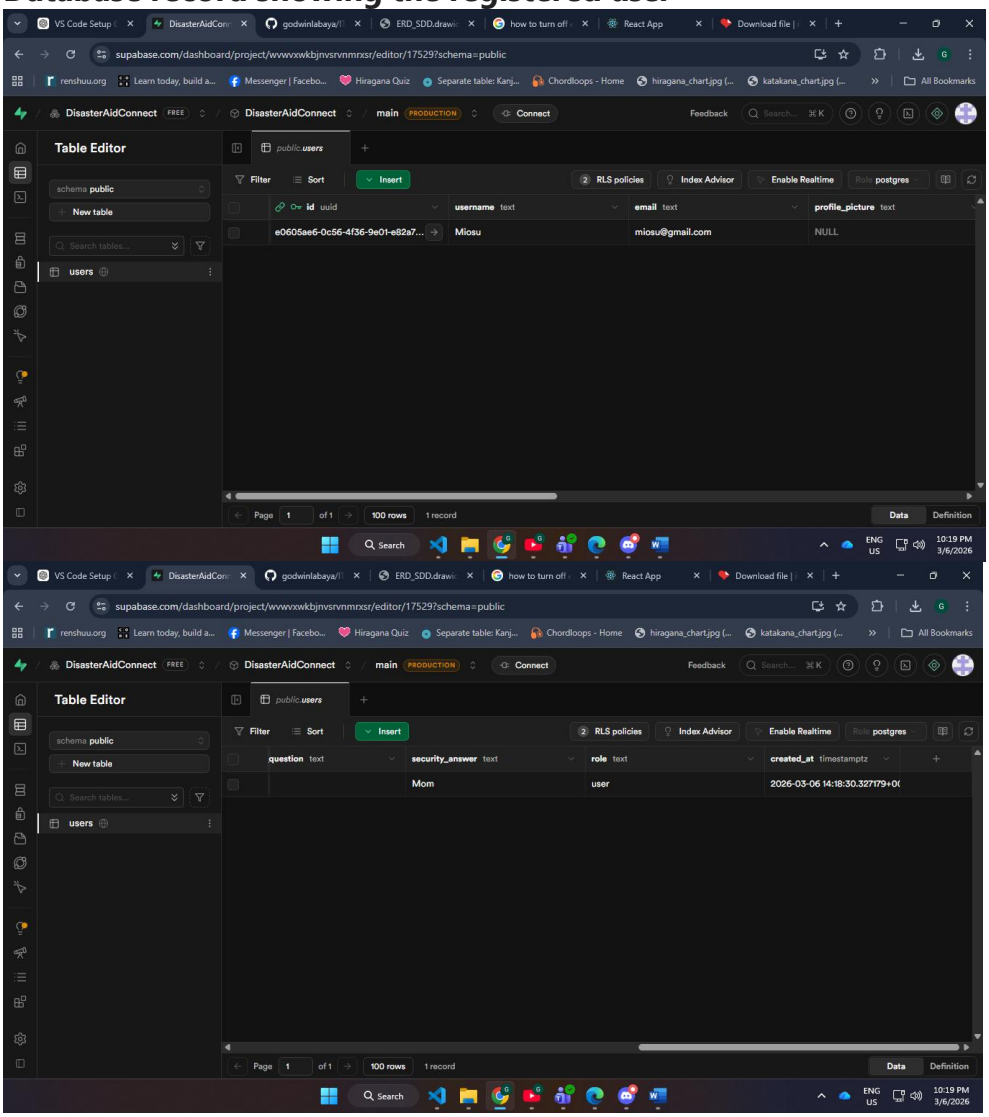
Login Page



Successful login



Database record showing the registered user



4. Short Implementation Summary (1 Page)

User Registration

- **Registration fields used:**
  - `username` – User's display name
  - `email` – User's email address
  - `password` – Password for account login
  - `confirmPassword` – To verify password correctness
  - `securityQuestion` – Question for password recovery
  - `securityAnswer` – Answer to the security question
- **Validation process:**
  - Checks if `password` matches `confirmPassword`.
  - Checks if `password` has 1 capital letter, 1 special character and a minimum of 8 total characters
  - Supabase automatically validates the email format.
- **How duplicate accounts are prevented:**
  - Supabase authentication service ensures each email is unique.
  - Attempting to register an existing email triggers an error message.
- **How passwords are stored securely:**
  - Supabase handles password hashing internally using secure hashing algorithms (bcrypt).
  - The app never stores plain text passwords.

User Login

- **Login credentials used:**
  - Email and password.
- **How the system verifies users:**
  - Checks if email and password exists in the Supabase database
  - Supabase compares the hashed password stored in the database with the entered password.
- **What happens after successful login:**
  - User is authenticated and navigated to the main application/dashboard.
  - Authentication session is managed by Supabase, allowing secure access to protected routes.

Database Table

- **Table:** `users`
- **Columns:**
  - `id` – Supabase `uuid` for user identification
  - `email` – Email display
  - `username` – User display name
  - `profile_picture` – for profile picture
  - `profile_picture_mime_type` – for profile picture format
  - `security_question` – Password recovery question
  - `security_answer` – Password recovery answer
  - `role` – User role (e.g., `user`)
- **Notes:**
  - Supabase also maintains its internal `auth.users` table that stores emails, hashed passwords, and metadata.

API Endpoints (if applicable)

- **Register user:**
  `POST /api/auth/register` → Handled via Supabase `auth.signUp()`
- **Login user:**
  `POST /api/auth/login` → Handled via Supabase `auth.signInWithPassword()`
